Data structures

General idea

Technical details

Designing data structures

Conclusion

### Lecture topics

- Mechanism of abstraction
- The need for data structures
- Classes as data structures in Python
- Tuples and records

TEAM

Introduction

What is abstraction?

Data structures

General idea

Technical

details

Designing data structures

Conclusion

## What is abstraction?

Data structures TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data

Conclusion

#### Introduction

- The big issue of the whole course is abstraction in programming
- Abstraction is a fundamental concept in programming to reduce repetition
- We sit atop a mountain of abstraction, which we make taller at every iteration

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

#### Grab the student next to you

 Describe what you just did so that someone else can perform the same action

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

#### Grab the student next to you

- Describe what you just did so that someone else can perform the same action
- Now add specific details about the movements of your arm and phalanges (pieces of fingers)

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

#### Grab the student next to you

- Describe what you just did so that someone else can perform the same action
- Now add specific details about the movements of your arm and phalanges (pieces of fingers)
- Now realize that there are even more subcomponents: individual muscles, tendons, etc.

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

#### Grab the student next to you

- Describe what you just did so that someone else can perform the same action
- Now add specific details about the movements of your arm and phalanges (pieces of fingers)
- Now realize that there are even more subcomponents: individual muscles, tendons, etc.
- But then we have also cells that make these up
- ...

Data structures

TEAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

#### Human love for abstraction

- Our brain cannot handle so many details
- To cope with this, we are structured in layers
- Our consciousness manipulates only the upper layers with simple instructions
- Raise arm above head

Data structures

TEAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data

Conclusion

#### Human love for abstraction

- The same happens with regular language
- "Go buy a liter of milk" is quite a short description
- The underlying operation is very complex

# Complexity of simple instructions

Data structures TFAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data

Conclusion

```
Go buy a liter of milk =
Turn game off
Get up from the couch
Curse the instruction giver
Get dressed
Put money in pocket
Leave house
Reach nearest shop
Enter shop
Find milk
Take one liter bottle
Pay milk
Go home
Give milk to instruction giver
```

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data

Conclusion

#### Human love for abstraction

- And clearly something like "reach nearest shop" is not a trivial instruction by itself
- Think about all the things you give for granted
  - Crossing roads
  - Traffic lights
  - Pathfinding
  - Road work and obstructions
  - Use of transportation methods
  - **.**..

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing

structures Conclusion

## **Data structures**

Data structures

TEAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Flying back to Earth

- How is this relevant for programmers?
- We have a similar issue with a modern computer

## A single Python instruction runs

Data structures TFAM

INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

## Flying back to Earth

- Moreover, sometimes we have repetition of constructs in our own code
- This means that we would like to extend the pyramid with our own stuff

# A single Python program runs

Data structures TFAM

INFDEV

. . . . . . .

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

#### What kind of "own stuff"?

- Any recurring structure, code, etc.
- We do not want to repeat it every time
- We just give it a name, instead of specifying it every time
- The actual goal is to make things simpler
  - Code reuse, maintainability, etc. do not exist
  - It is all just properly built abstractions that make reasoning about code easier

Data structures TFAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

```
playerOneName = "P1"
playerOnePositionX = 0.0
playerOnePositionY = 0.0

playerTwoName = "P2"
playerTwoPositionX = 5.0
playerTwoPositionY = 0.0

playerThreeName = "P3"
playerThreePositionX = 10.0
playerThreePositionY = 0.0
```

Data structures TFAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

```
playerOneName = "P1"
playerOnePositionX = 0.0
playerOnePositionY = 0.0

playerTwoName = "P2"
playerTwoPositionX = 5.0
playerTwoPositionY = 0.0

playerThreeName = "P3"
playerThreePositionX = 10.0
playerThreePositionY = 0.0
```

Now let's add a score, an exp level, etc.

Data structures TFAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

```
playerOneName = "P1"
playerOnePositionX = 0.0
playerOnePositionY = 0.0

playerTwoName = "P2"
playerTwoPositionX = 5.0
playerTwoPositionY = 0.0

playerThreeName = "P3"
playerThreePositionX = 10.0
playerThreePositionY = 0.0
```

Now let's add a score, an exp level, etc.

Does it scale well?

Data structures

TEAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Make some examples

- Everyone make an example of repeated structures of data.
- Some of you will present theirs

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing

structures Conclusion

## General idea

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

#### Introduction

- A possible solution to this problem is capturing the repetition of data structures
- With a name, and a specification of what is common about them

Data structures

TEAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

- Brains of the programmer, always active
- Abstraction requires awareness and experience
- It is as much technique as it is art

Data structures TFAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

```
playerOneName = "P1"
playerOnePositionX = 0.0
playerOnePositionY = 0.0

playerTwoName = "P2"
playerTwoPositionX = 5.0
playerTrwoPositionY = 0.0

playerThreeName = "P3"
playerThreePositionX = 10.0
playerThreePositionY = 0.0
```

Data structures TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

- We observe that there is an underlying pattern, which we will call abstraction
- The pattern, or abstraction, comes repeated in several concrete instances in our program

Data structures TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

- We observe that there is an underlying pattern, which we will call abstraction
- The pattern, or abstraction, comes repeated in several concrete instances in our program
- In the program above this is fairly obvious, in real life not always really:)

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

- A proper name for the abstraction
- For example?

Data structures TFAM

INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

- A proper name for the abstraction
- For example? Player

Data structures TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data

Conclusion

- A set of common attributes
- All characterizing aspects of the abstraction that are common to all its instances
- For example?

Data structures TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

- A set of common attributes
- All characterizing aspects of the abstraction that are common to all its instances
- For example? Name, PositionX, PositionY

## The blueprint (THIS IS NOT CODE!)

Data structures \_TEAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

```
Abstraction Player =
Name, which is a string
PositionX, which is a number
PositionY, which is a number
```

The abstraction above is called a **data structure**.

It is not valid Python code, but it is a blueprint specifying a recurrent set of attributes that often go together to identify a player.

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

## **Technical details**

### Technical details

Data structures TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

## How is this done in Python?

- Python offers a facility called class
- It is used to capture a data structure.

## Syntax of Python classes

Data structures

TEAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

```
class <<Name>>:
    def __init__(self, <<v1>>, <<v2>>, ..., <<vN>):
        self.<<Ai>> = <<v1>>
        self.<<A2>> = <<v2>>
        ...
        self.<<AN>> = <<vN>>
```

The class has thus: name, initial values  $v_1$  through  $v_N$ , and attributes  $A_1$  through  $A_N$  initialized with \_\_init\_\_.

self is a reference to the concrete instance that is being set up.

## Usage of Python classes

Data structures

TEAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

```
x = << \text{Name} >> (<< v1>>, << v2>>, ..., << vN>)
```

Sets up a concrete instance of <<Name>> with some initial values.

## Usage of Python classes

Data structures

structure

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

print(x.<<A2>>)

Prints the value of the second attribute of the concrete instance called x of class <<Name>>.

## Usage of Python classes

Data structures

TEAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data

Conclusion

x.<<A3>> = y

Assigns y as the new value of the third attribute of the concrete instance called x of class << Name>>.

Data structures TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Semantics of Python classes

- The semantics of Python classes require a more sophisticated model of memory
- Memory is now divided in two

**STACK** The state that we used so far, for primitive values (int, string, etc.)

**HEAP** A storage for complex values such as classes

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Semantics of Python classes

 An instruction I will now transform the initial heap and stack H,S into the resulting (possibly changed) heap and stack H',S'

$$\langle PC, H, S \rangle \xrightarrow{I} \langle PC', H', S' \rangle$$

<sup>a</sup>in addition to the program counter PC, which always behaves in the same way

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Semantics of creation

- Consider creation of a Python class: x = <<Name>>(...)
   (shortened to xName)
- This affects both memories

**HEAP** We create and initialize a new instance of class <<Name>>

**STACK** We add an entry x to the stack, which references to the newly created instance

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Semantics of creation

- Given that:
- |H| is the size of the heap at creation, which we call the address of the new instance
- $\langle\!\langle Name \rangle\!\rangle$  (...) is a new instance of the class, which contains a map from the attribute names to their values

$$< PC, H, S > \xrightarrow{xName} < PC + 1, H[|H| \mapsto \langle \langle Name \rangle \rangle (\dots)], S[x \mapsto |H|] >$$

- x is, unsurprisingly, called a reference
  - it does not contain the value of the class instance
  - it merely tells us where to find it

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Attribute lookup

- Consider reading an attribute (also called lookup)
- x.<<A>> (shortened to xA)
- Where is it in memory?

**STACK** We find an entry x, which tells us where the corresponding instance of the class is found

**HEAP** We find the actual attribute in the map of attributes

$$\langle PC, H, S \rangle \xrightarrow{xA} \langle PC + 1, H[S[x]][\langle \langle A \rangle \rangle], S >$$

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Attribute update

- Consider assigning to an attribute
- x. << A>> = v (shortened to xAv)
- Where is it in memory?

**STACK** We find an entry x, which tells us where the corresponding instance of the class is found

**HEAP** We reassign the actual attribute in the map of attributes

$$\langle PC, H, S \rangle \xrightarrow{xAv} \langle PC + 1, H[S[x] \mapsto S[x][A \mapsto v]]$$

Data structures

TEAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Examples

- We can now implement our player data type
- We will use a Python class to do so
- We will then create concrete instances of it, and use them

## The blueprint to implement

Data structures

TEAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

```
Abstraction Player =
Name, which is a string
PositionX, which is a number
PositionY, which is a number
```

## The implemented class

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

```
class Player:
    def __init__(self, name, posX, posY):
    self.Name = name
    self.PositionX = posX
    self.PositionY = posY
```

Data structures TFAM

Introduction

What is

Data structures

General idea

Technical details

Designing data structures

Conclusion

```
playerOneName = "P1"
playerOnePositionX = 0.0
playerOnePositionY = 0.0

playerTwoName = "P2"
playerTwoPositionX = 5.0
playerTwoPositionY = 0.0

playerThreeName = "P3"
playerThreePositionX = 10.0
playerThreePositionY = 0.0
```

#### Becomes:

```
playerOne = Player("P1", 0.0, 0.0)
playerTwo = Player("P2", 5.0, 0.0)
playerThree = Player("P3", 10.0, 0.0)

Conclusion

## **Designing data structures**

Data structures TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Are we there yet?

- We can keep extending our knowledge about the problem
- For example, we might notice that PositionX and PositionY might happen in other places of the program
- What could we do?

Data structures TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Are we there yet?

- We can keep extending our knowledge about the problem
- For example, we might notice that PositionX and PositionY might happen in other places of the program
- What could we do?
- We could define a Point2D (or Vector2D) data structure!

### Refined data structures

Data structures

TEAM

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

```
class Vector2:
    def __init__(self, x, y):
        self.X = x
        self.Y = y

class PlayerRefined:
    def __init__(self, name, posX, posY):
        self.Name = name
        self.Position = Vector2(posX,posY)
```

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Refined data structures

- Creation is precisely identical to the previous sample
- The \_\_init\_\_ of the PlayerRefined has the same inputs
- Where we had playerOne = Player("P1", 0.0, 0.0)
- Now we have playerOne = PlayerRefined("P1", 0.0, 0.0)

Data structures TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Refined data structures

- Usage of the new player definition is almost identical to the previous
- Only changes are lookups like: playerOne.PositionY
- What do they become now?
- playerOne.Position.Y

Data structures TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Refined data structures

- What does memory look like now with a player that contains a vector?
- Stack is similar to previous instance
- Heap contains a reference to a vector!

Data structures

structures Conclusion

н —

Н

playerOne = PlayerRefined("P1", 0.0, 0.0)

 $\begin{array}{c|c} S & \begin{array}{c|c} PC & playerOne \\ \hline 2 & ref(0) \end{array}$ 

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### What characterizes a good design of data structures?

- Reuse of code in places where otherwise repetition would happen
- Encapsulation of the semantics of the data structure
- Loose coupling between the data structure and the rest of the program

Data structures

TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Reuse of code

- Repetition is dangerous
- A small change in one place but not in the others can lead to unexpected consequences
- More code to read means more mental overhead
- Actual work of the program is hidden under lots of noise and thus less visible

Data structures TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Encapsulation

- A data structure has a single, clear, well-defined goal
- Its name clearly explains what it contains and does
- There is no multiple functionality mix

Data structures TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Encapsulation

- A data structure has a single, clear, well-defined goal
- Its name clearly explains what it contains and does
- There is no multiple functionality mix
- It's a cold beer, not a cocktail

Data structures TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### Loose coupling

- A data structure is a closed and complete unit
- To use it, you just need to declare it and initialize it
- The rest of the program integrates a well-designed data structure with minimal modification

Data structures TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### How do we verify all this?!?

- Takes experience and good taste
- It is an old story
- Remember: you have the power to make your own life a living Hell...

Data structures TEAM INFDEV

Introduction

What is abstraction?

Data structures

General idea

Technical details

Designing data structures

Conclusion

### How do we verify all this?!?

- Takes experience and good taste
- It is an old story
- Remember: you have the power to make your own life a living Hell...
- ...unless you reason first and write code after

Data structures

Designing data structures

Conclusion

### Lecture topics

- Abstraction is the fundamental mechanism that allows us to group concepts together and refer to them as if they were a single concept
- For example, a name and two numbers became a player
- We then use the new concept (the player) without having to explicitly mention all of its components every time
- This makes it leaner for us to manipulate complex programs, as less concepts ("actors") make an appearance

### This is it!
